SD Memory Card Formatter END USER LICENSE AGREEMENT

NOTICE:
BY DOWNLOADING, INSTALLING OR USING THE PRODUCT, THE ENTITY OR INDIVIDUAL ENTERING INTO THIS AGREEMENT AGREES TO BE BOUND BY THE FOLLOWING TERMS. IF YOU DO NOT AGREE WITH ANY OF THESE TERMS, DO NOT DOWNLOAD, INSTALL, OR USE THE PRODUCT. PROMPTLY RETURN (IF APPLICABLE) THE PRODUCT TO THE SDA OR YOUR SDA DISTRIBUTOR. IF YOU REJECT THIS AGREEMENT, YOU WILL NOT ACQUIRE ANY LICENSE TO USE THE PRODUCT.

This Agreement ("Agreement") is between the entity or individual entering into this Agreement ("You") and the SD Card Association, a California Mutual Benefit Corporation ("SDA"). "You" includes you and your employees and Affiliates. "Affiliate" is defined as an entity which controls, is controlled by, or shares common control with a party where such control may exist through ownership of securities or by contract. In addition to the restrictions imposed under this Agreement, any other usage restrictions contained in the Product Installation Instructions or release notes shall apply to Your use of the Product.

1. PRODUCT. "SDA Software" means the object code version of the SD Memory Card Formatter

Install Raspberry Pi OS using Raspberry Pi Imager

Raspberry Pi Imager is the quick and easy way to install Raspberry Pi OS and other operating systems to a microSD card, ready to use with your Raspberry Pi. [Watch our 40-second video](#) to learn how to install an operating system using Raspberry Pi Imager.

Download and install Raspberry Pi Imager to a computer with an SD card reader. Put the SD card you'll use with your Raspberry Pi into the reader and run Raspberry Pi Imager.

Configuring wireshark-common

Dumpcap can be installed in a way that allows members of the "wireshark" system group to capture packets. This is recommended over the alternative of running Wireshark/Tshark directly as root, because less of the code will run with elevated privileges.

For more detailed information please see /usr/share/doc/wireshark-common/README.Debian.

Enabling this feature may be a security risk, so it is disabled by default. If in doubt, it is suggested to leave it disabled.

Should non-superusers be able to capture packets?

<Yes>

<No>

Chapter 3: Introduction to ESP Development Boards

Arduino IDE 1.8.19

The open-source Arduino Software (IDE) makes it easy to write code and upload it to the board. This software can be used with any Arduino board.

Refer to the [Getting Started](#) page for Installation instructions.

SOURCE CODE

Active development of the Arduino software is [hosted by GitHub](#). See the instructions for [building the code](#). Latest release source code archives are available [here](#). The archives are PGP-signed so they can be verified using [this](#) gpg key.

[More Info](#)

Close

boolean **connect** (clientId, [username, password], [willTopic, willQoS, willRetain, willMessage], [cleanSession])

Connects the client.

Parameters

- clientId `const char[]` - the client ID to use when connecting to the server
- Credentials - *(optional)*
 - username `const char[]` - the username to use. If NULL, no username or password is used
 - password `const char[]` - the password to use. If NULL, no password is used
- Will - *(optional)*
 - willTopic `const char[]` - the topic to be used by the will message
 - willQoS `int`: 0, 1 or 2 - the quality of service to be used by the will message
 - willRetain `boolean` - whether the will should be published with the retain flag
 - willMessage `const char[]` - the payload of the will message
- cleanSession `boolean` *(optional)* - whether to connect clean-session or not

Returns

- `false` - connection failed
- `true` - connection succeeded

boolean **publish** (topic, payload, [length], [retained])

Publishes a message to the specified topic.

Parameters

- topic `const char[]` - the topic to publish to
- payload `const char[], byte[]` - the message to publish
- length `unsigned int (optional)` - the length of the payload. Required if payload is a `byte[]`
- retained `boolean (optional)` - whether the message should be retained
 - false - not retained
 - true - retained

Returns

- false - publish failed, either connection lost or message too large
- true - publish succeeded

boolean **subscribe** (topic, [qos])

Subscribes to messages published to the specified topic.

Parameters

- topic `const char[]` - the topic to subscribe to
- qos `int: 0 or 1 only (optional)` - the qos to subscribe at

Returns

Chapter 4: Node-RED on Raspberry Pi

```
login as: pi
pi@192.168.1.15's password:
Linux raspberrypi 5.10.17-v7+ #1403 SMP Mon Feb 22 11:29:51 GMT 2021 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Wed Mar 31 19:02:04 2021

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set
a new password.

pi@raspberrypi:~ $
```

Running Node-RED install for user pi at /home/pi on raspbian

This can take 20-30 minutes on the slower Pi versions - please wait.

Stop Node-RED	✓	
Remove old version of Node-RED	✓	
Remove old version of Node.js	✓	
Install Node.js 14 LTS	✓	v14.17.0 Npm 6.14.13
Clean npm cache	✓	
Install Node-RED core	✓	1.3.5
Move global nodes to local	-	
Npm rebuild existing nodes	✓	
Install extra Pi nodes	✓	
Add shortcut commands	✓	
Update systemd script	✓	

Any errors will be logged to /var/log/nodered-install.log

All done.

You can now start Node-RED with the command `node-red-start`

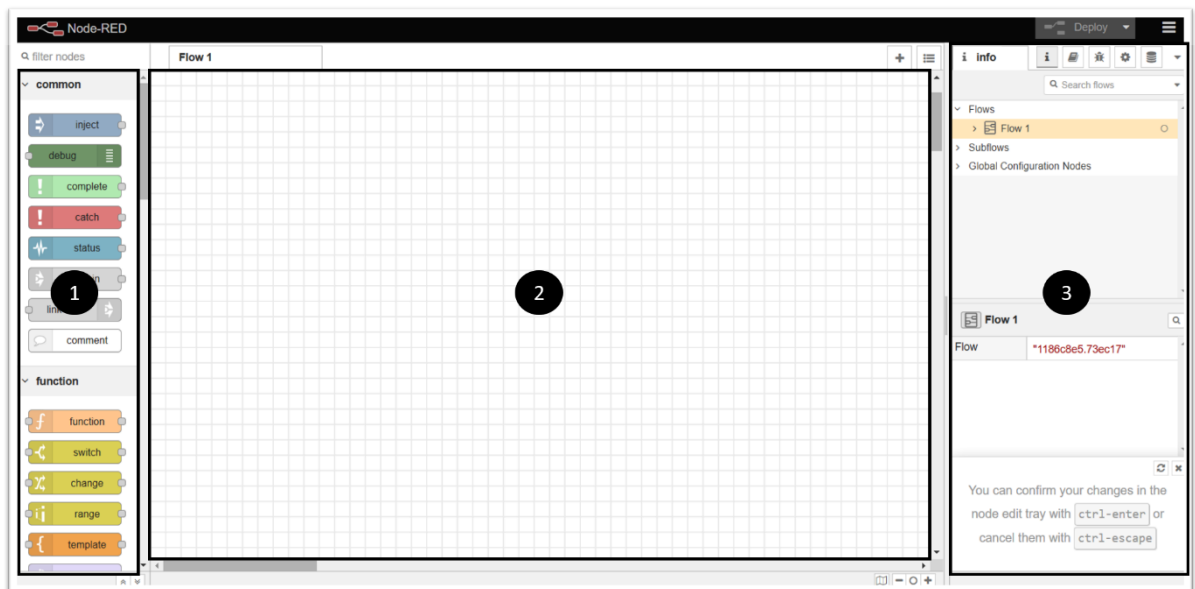

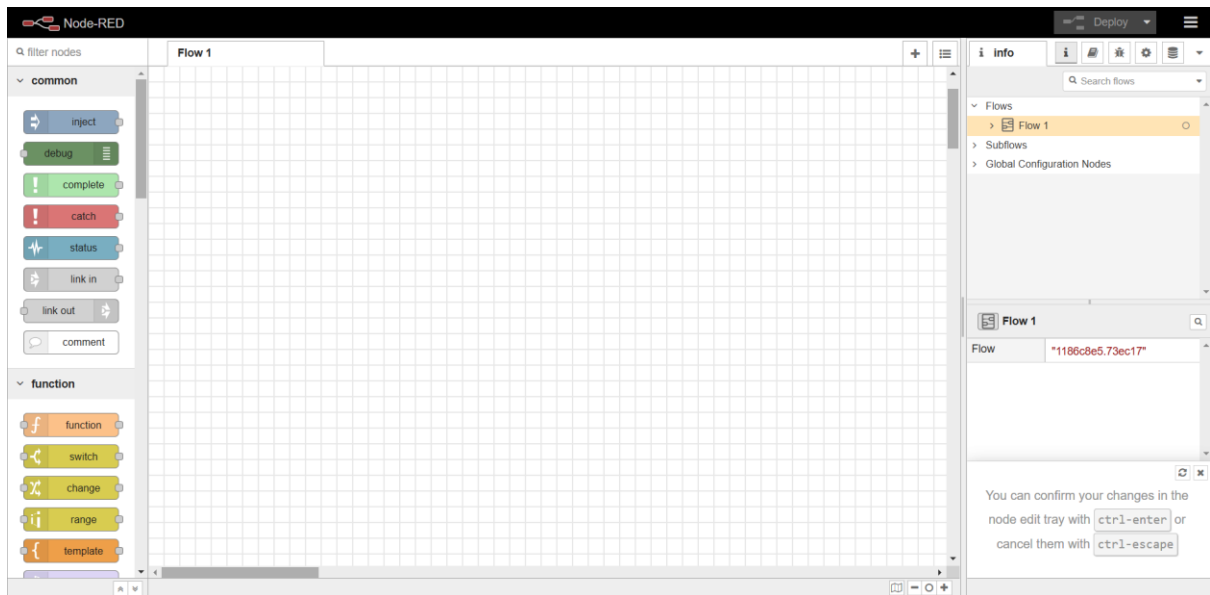

or using the icon under Menu / Programming / Node-RED

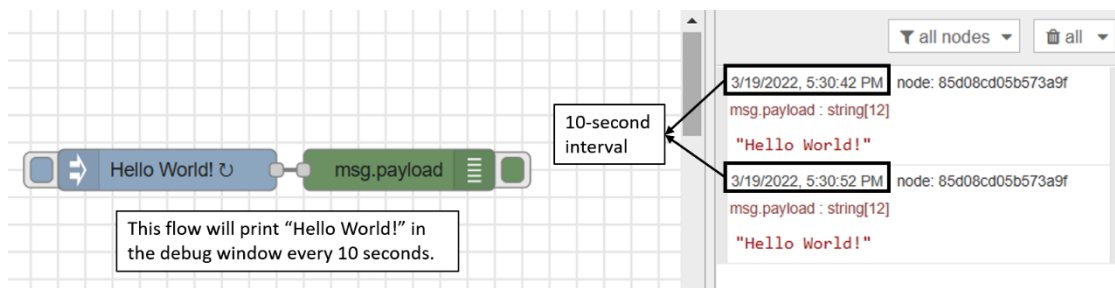

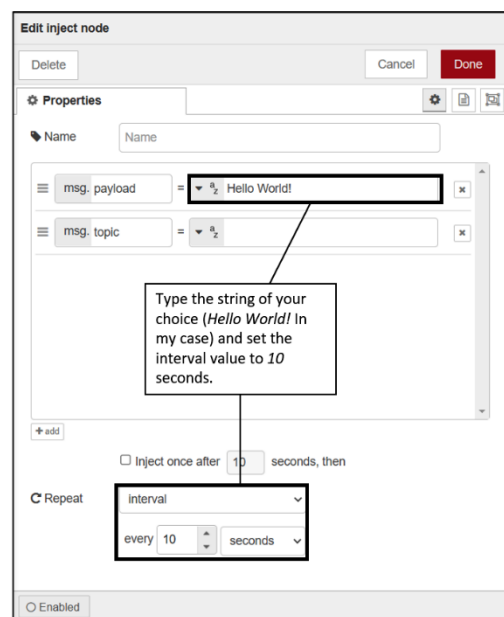

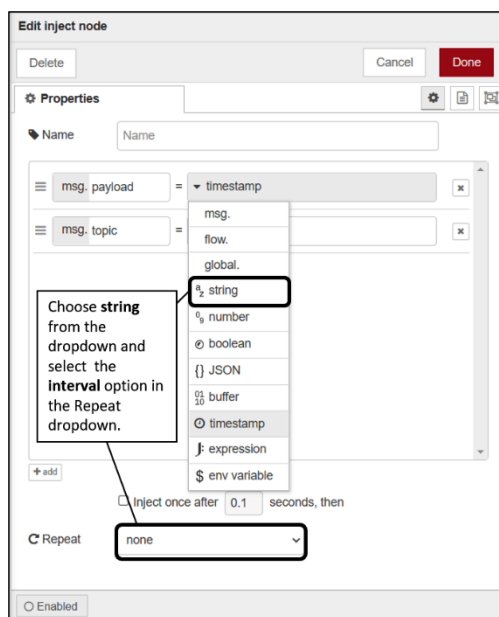

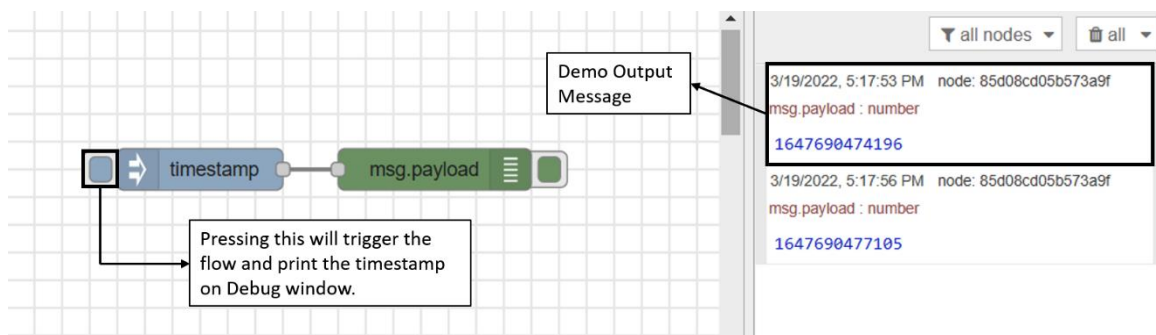

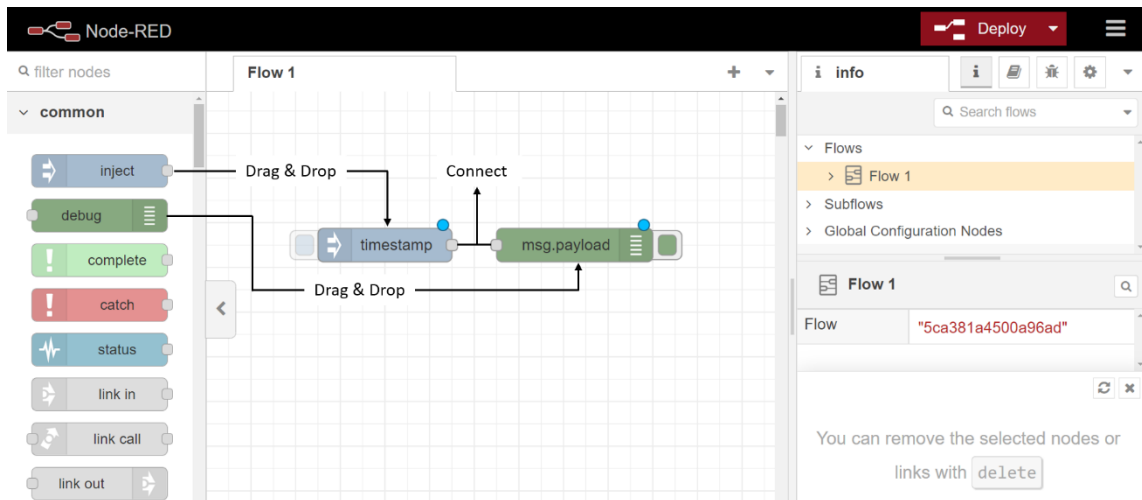

Then point your browser to `localhost:1880` or `http://{your_pi_ip-address}:1880`

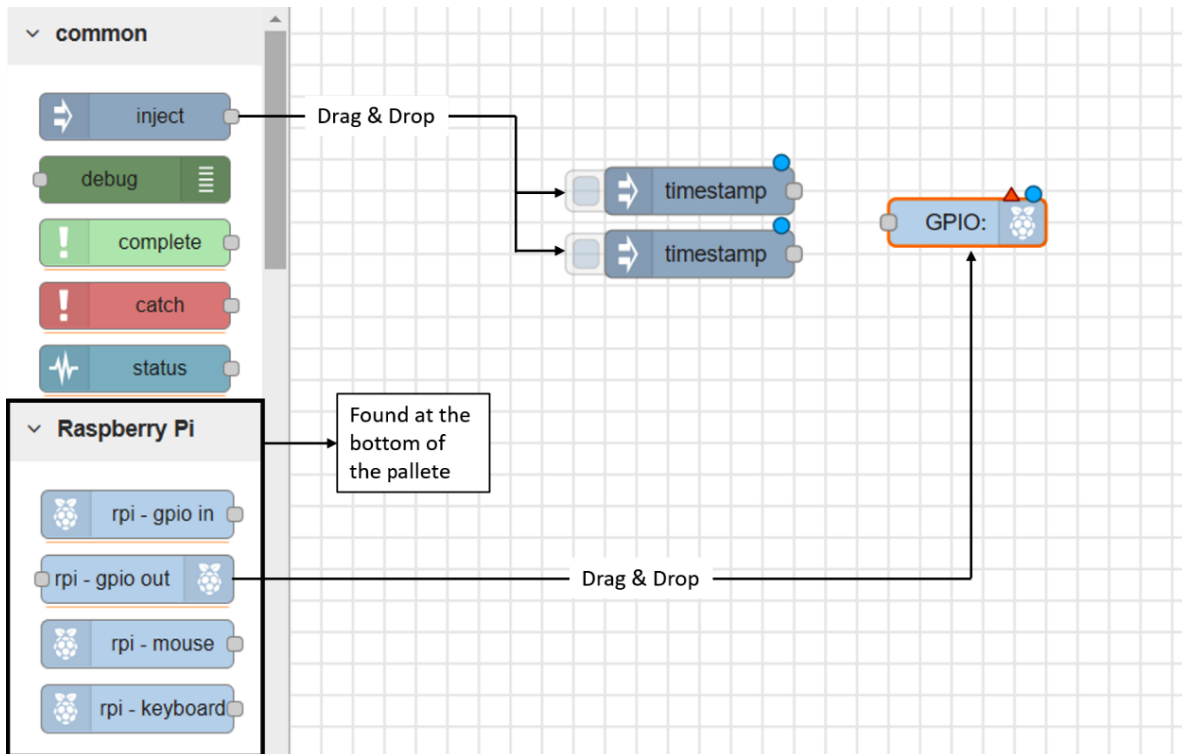

Started : Sun 13 Jun 2021 04:45:00 PM IST

Finished: Sun 13 Jun 2021 04:50:09 PM IST

```
pi@raspberrypi:~ $
```

Dashboard Layout Setup

- ❖ First, create a new Tab using the **+tab** button and rename to "IoT Weather Station".
- ❖ Then using the **+group** button on the tab, create four groups as shown in the figure.
- ❖ Now, all you have to do is add your widgets to individual groups. For this project, we will follow the layout shown below. Hence, we will be adding a *Gauge* and any of the other two widgets in each group.

IoT Weather Station Dashboard Layout

Text Node

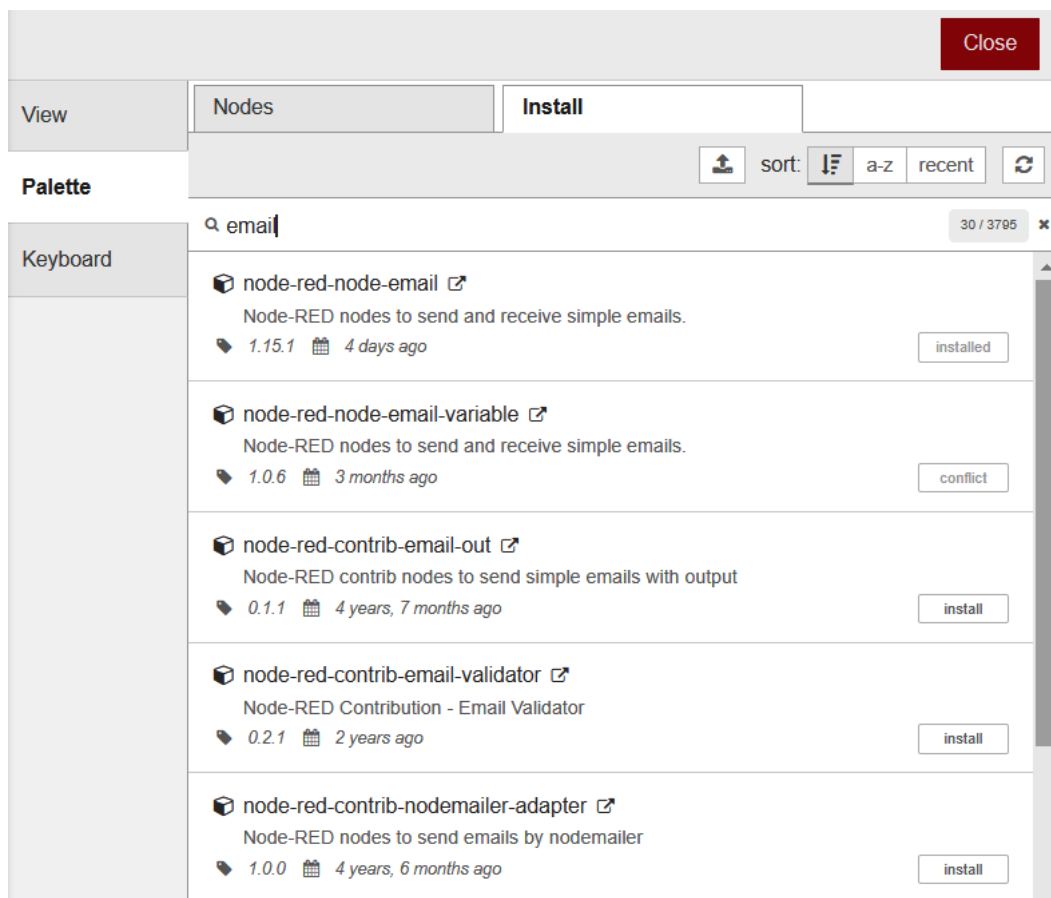

Please fill in the marked values according to the information provided. Set size to **6x6**.

For example: For Pressure values, input *Label* as “**Pressure**”, add the unit in *Value format* as “**{{msg.payload}} Pa**” and input “**Pressure**” in *Name*.

Chart Node

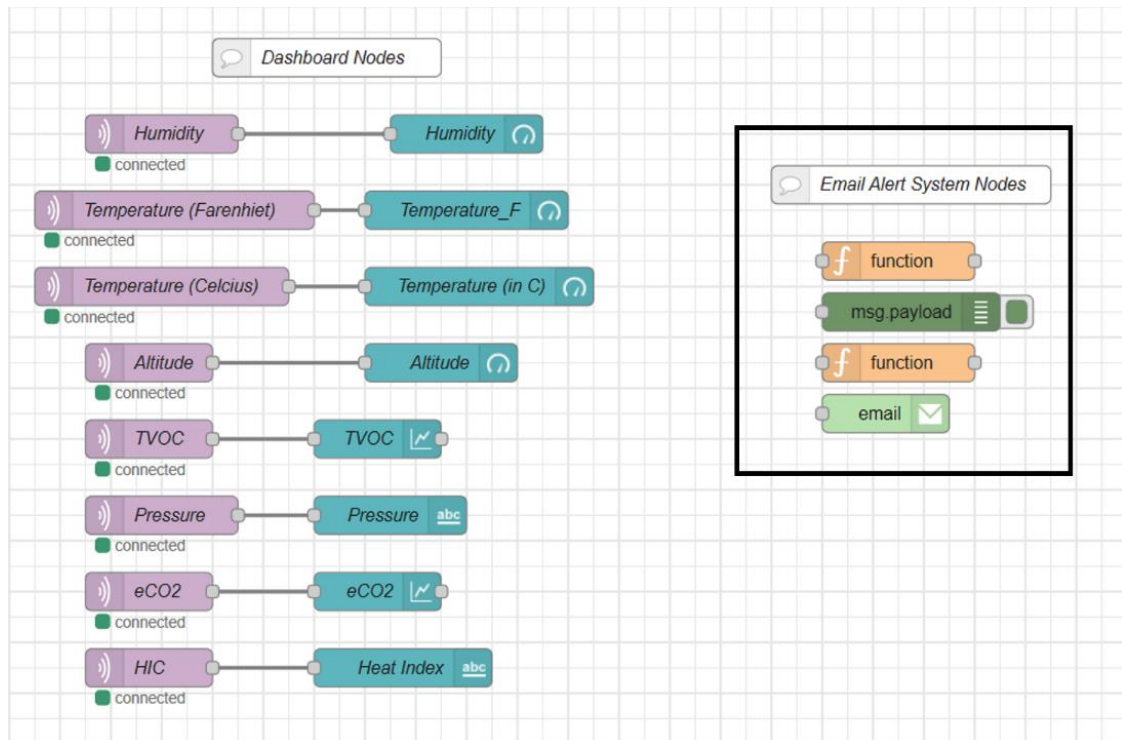

We will create line charts. Fill in the text box info, set size to **6x6**, and for x-axis, just enter a **time range** (2 minutes). Then add the **range** of sensor values (Eg: 0 - 50°C). Lastly, the down arrow indicates that the screen needs to be scrolled. The last thing to input is the *Name* of the node.

Update Droplet Console

To enable the Droplet Console, log in to your Droplet as root or as a user with sudo access. Once connected, download and execute the agent installation script with the following command to enable the console immediately:

```
wget -qO- https://repos-droplet.digitalocean.com/install.sh | sudo bash
```

[Copy](#)
If you need to use the recovery ISO or can't connect using the Droplet Console, use the Recovery Console instead.

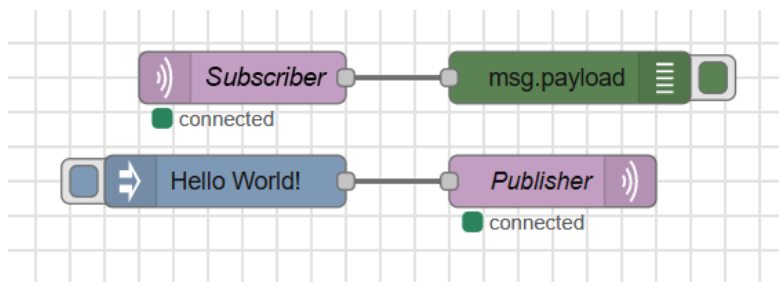

[OK, I will install the new console agent](#) [Launch Recovery Console](#)

AWS IoT

Securely connect, test, and manage your IoT devices

AWS IoT can support billions of devices and trillions of messages. It can process and route those messages to AWS endpoints and to other devices reliably and securely.

Get started with AWS IoT

Quick connect guides you through connecting a device in about 15 minutes. You'll register your first device and watch it send MQTT messages to AWS IoT.

[Connect device](#)

How it works

The AWS IoT console supports these common activities. **Bold text** refers to an entry in the left navigation pane. To learn more about a topic, see its overview.

[Alt+S]

AWS IoT > Manage > Things > Create things

Create things [Info](#)

A thing resource is a digital representation of a physical device or logical entity in AWS IoT. Your device or entity needs a thing resource in the registry to use AWS IoT features such as Device Shadows, events, jobs, and device management features.

Number of things to create

☒ Create single thing
Create a thing resource to register a device. Provision the certificate and policy necessary to allow the device to connect to AWS IoT.

☐ Create many things
Create a task that creates multiple thing resources to register devices and provision the resources those devices require to connect to AWS IoT.

Cancel

Configure device certificate

Step 3 - optional
Attach policies to certificate

Specify thing properties [Info](#)

A thing resource is a digital representation of a physical device or logical entity in AWS IoT. Your device or entity needs a thing resource in the registry to use AWS IoT features such as Device Shadows, events, jobs, and device management features.

Thing properties [Info](#)

Thing name

NodeMCU

Just specify the Device Name

Enter a unique name containing only: letters, numbers, hyphens, colons, or underscores. A thing name can't contain any spaces.

Additional configurations

You can use these configurations to add detail that can help you to organize, manage, and search your things.

▶ Thing type - optional

▶ Searchable thing attributes - optional

▶ Thing groups - optional

▶ Billing group - optional

AWS IoT > Manage > Things > Create things > Create single thing

Step 1

Specify thing properties

Step 2 - optional

Configure device certificate

Step 3 - optional

Attach policies to certificate

Configure device certificate - optional [Info](#)

A device requires a certificate to connect to AWS IoT. You can choose how you to register a certificate for your device now, or you can create and register a certificate for your device later. Your device won't be able to connect to AWS IoT until it has an active certificate with an appropriate policy.

Device certificate

☒ **Auto-generate a new certificate (recommended)**
Generate a certificate, public key, and private key using AWS IoT's certificate authority.

☐ **Use my certificate**
Use a certificate signed by your own certificate authority.

☐ **Upload CSR**
Register your CA and use your own certificates on one or many devices.

☐ **Skip creating a certificate at this time**
You can create a certificate for this thing and attach a policy to the certificate at a later time.

Cancel

Previous

Next

Attach policies to certificate - optional [Info](#)

AWS IoT policies grant or deny access to AWS IoT resources. Attaching policies to the device certificate applies this access to the device.

Policies (0)
Select up to 10 policies to attach to this certificate.

Download certificates and keys

Download and install the certificate and key files to your device so that it can connect securely to AWS IoT. You can download the certificate now, or later, but the key files can only be downloaded now.

Device certificate

`badae763707...te.pem.crt`

Just download all these certificate and key files

 **Download**

Key files

The key files are unique to this certificate and can't be downloaded after you leave this page. Download them now and save them in a secure place.

 **This is the only time you can download the key files for this certificate.**

Public key file

`badae763707017f6f7cae55...d7bb87e-public.pem.key`

 **Download**

Private key file

`badae763707017f6f7cae55...7bb87e-private.pem.key`

 **Download**

Root CA certificates

Download the root CA certificate file that corresponds to the type of data endpoint and cipher suite you're using. You can also download the root CA certificates later.

Amazon trust services endpoint

RSA 2048 bit key: Amazon Root CA 1

 **Download**

Amazon trust services endpoint

ECC 256 bit key: Amazon Root CA 3

 **Download**

If you don't see the root CA certificate that you need here, AWS IoT supports additional root CA certificates. These root CA certificates and others are available from our

Settings

Device data endpoint

Your devices can use your account's device data endpoint to connect to AWS.

Each of your things has a REST API available at this endpoint. MQTT clients and AWS IoT Device SDKs also use this endpoint.

Endpoint

ats.iot.us-east-1.amazonaws.com

Domain configurations

You can create domain configurations to simplify tasks such as migrating devices to AWS IoT Core, migrating application infrastructure to AWS IoT Core and maintaining brand identity.

Actions

Create domain configuration

	Name	Domain name	Status	Service type	Date updated
No domain configurations					
You don't have any domain configurations.					
Create domain configuration					

Just of the Settings section in IoT Core and you will get the Endpoint address you need for the Arduino code.

AWS IoT > MQTT test client

MQTT test client

You can use the MQTT test client to monitor the MQTT messages being passed in your AWS account. Devices publish MQTT messages that are identified by topics to communicate their state to AWS IoT. AWS IoT also publishes MQTT messages to inform devices and apps of changes and events. You can subscribe to MQTT message topics and publish MQTT messages to topics by using the MQTT test client.

Subscribe to a topic

Publish to a topic

Topic filter

The topic filter describes the topic(s) to which you want to subscribe. The topic filter can include MQTT wildcard characters.

Enter the topic filter

Apache2 Debian Default Page

It works!

This is the default welcome page used to test the correct operation of the Apache2 server after installation on Debian systems. If you can read this page, it means that the Apache HTTP server installed at this site is working properly. You should **replace this file** (located at `/var/www/html/index.html`) before continuing to operate your HTTP server.

If you are a normal user of this web site and don't know what this page is about, this probably means that the site is currently unavailable due to maintenance. If the problem persists, please contact the site's administrator.

Configuration Overview

Debian's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Debian tools. The configuration system is **fully documented** in `/usr/share/doc/apache2/README.Debian.gz`. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the **manual** if the `apache2-doc` package was installed on this server.

The configuration layout for an Apache2 web server installation on Debian systems is as follows:

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
```

- `apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
