

Chapter 1: The Automation Journey and Identifying Suitable Business Processes

Industry	Automated Processes
Services	<ul style="list-style-type: none">• Customer invoicing• Claim processing• Call center processes
Financial	<ul style="list-style-type: none">• Fraud detection and prevention• Data integration (internal and external sources)• Account settlement• Automatic account opening• Automatic account closure• Loan processing• Credit card requisition• Enabling/disabling credit cards• Customer onboarding
Healthcare	<ul style="list-style-type: none">• Digitizing and updating patient records• Inventory management• Invoice settlement• Automated report generation
Education	<ul style="list-style-type: none">• Course registration• Attendance management• Course schedule management• Processing grades and report cards
Technology	<ul style="list-style-type: none">• Complaint management• Client management by updating data• Enable/disable client services
Manufacturing	<ul style="list-style-type: none">• Inventory management• Procurement management• Payment processing• Customer communication• Invoice processing• Purchase order management
Retail	<ul style="list-style-type: none">• Employee onboarding• Employee offboarding• Employee payroll processing• Invoice processing• Return processing• Sales analytics
Government	<ul style="list-style-type: none">• Benefit claims• Fraud prevention• Payer data updating

Process fitness	
The process should be rule-based	The decisions taken on the data processed are required to be backed by a predefined set of rules.
Low exception rates	The process should not have many scenarios where we cannot complete the process due to unknown conditions.
Repetitive actions	<p>Considering the repetitive nature of the processes, they require further categorization:</p> <ul style="list-style-type: none"> • <i>Manual and non-repetitive</i>: Processes that require manual executions, but the steps executed in each run are different and nonrepetitive. The functions of such nature are not suitable for automation because automation requires a standard set of steps. • <i>Manual and repetitive</i>: The processes that require manual execution and the steps executed in each run are the same and repetitive. The functions of such nature are highly suitable for automation. However, the repeated actions require proper standards to ensure high efficiency. • <i>Semi-automated and repetitive</i>: The steps performed in the process are repetitive, but some of the steps are already automated using macros or other automation methods. With proper analysis of the process, possible automation opportunities can be identified. • <i>Automated</i>: If the process is already automated, introducing RPA is not required.
Standard input	Inputs provided to the process should either be electronic and easily readable, or readable using the technology that RPA is associated with (such as OCR).
Stable process	The process should not undergo frequent changes in the steps performed.

Automation Complexity	
Types of applications	Some of the applications we use today, such as the Office suite, are easy to automate. However, we do come across very complex applications such as mainframe applications that increase the automation effort. A complete process may require the interaction of multiple applications of such nature. This point plays a significant role when identifying the automation suitability of a process.
Number of screens that require interaction in the application	Similar to a human worker, RPA robots interact with the elements shown on a specific screen of an application. The actions performed might require navigation to multiple screens of an application. The robot is programmed to perform different actions based on the elements shown on the application screen. The higher the number of screens that require interaction, the more effort needed to program the robot.
Types of input	As stated already, the more standard the input is, the less effort is needed to manipulate and prepare the data. However, there are cases where the information is not standardized, and it requires conversion to a standard format, which requires additional effort. The complexity depends on how standard the input is. For example, if the RPA robot requires data extraction from a paragraph of text, it is one of the most complex inputs. On the other hand, if the RPA robot requires data extraction from a structured Excel file, it is one of the least complex inputs.
Number of input	The higher the number of inputs, the higher the complexity is.
Business decisions	The higher the number of decisions taken within the process flow, the higher the complexity is.

Chapter 02: UiPath Ecosystem

Particulars	Minimum	Recommended
CPU Cores	2 x 1.8 GHz 32-bit (x86)	4 x 2.4 GHz 64-bit (x64)
RAM	4 GB	8 GB
Operating Systems	Windows 8.1	Windows 10
.NET Framework	Version 4.6.1	Version 4.6.1 or greater

Robot Type	Description
Attended Robot	Is it triggered manually by the user or through user events. The robot agent runs in the same machine where the human user works, assisting the user's daily activities.
Unattended Robot	Runs in virtual machines and executes processes without any human intervention. The Orchestrator manages the unattended robots by controlling the executions, monitoring, and managing the data through queues.
Development Robot	Features are the same as the unattended robot but only used to connect the UiPath Studio to Orchestrator and for development purposes.
Non-Production Robot	Used only for development and testing purposes.

The screenshot shows the UiPath Orchestrator interface. On the left is a sidebar with navigation icons for Home, Orchestrator, Studio, Actions, Apps, Processes, Test Manager, Data Service, and Help. The top navigation bar includes the UiPath Orchestrator logo, a 'Shared' dropdown, and icons for search, help, notifications, and user profile. The main content area displays a dashboard with several widgets: 'Monitoring' (Assets: 0, Queues: 1, Triggers: 0), 'Users' (4), 'Machines' (0), and a 'Jobs History' section showing a donut chart with 'No Jobs'. A context menu is open over the 'Jobs' section, listing actions like 'Link', 'Assign', 'Start Job', and 'Folder management' (Create new sub-folder, Move, Edit, Delete). Below the dashboard, a transaction log shows 'Transactions April 26, 10:00 AM - April 27, 9:00 AM'.

The screenshot shows the 'Packages' page in the UiPath Orchestrator. The top navigation bar includes the UiPath Orchestrator logo, a search bar, and icons for Robots, Folders, Monitoring, Manage Access, Machines, Packages, Audit, Credential Stores, and Webhooks. The 'Packages' section is active, displaying a table of installed packages. The table has columns for Name, Description, Execution type, Compatibility, Published, Labels, and Properties. The first package listed is 'MySecondRobot', described as a 'Blank Process', with an 'Unattended' execution type and 'Windows - Legacy (.net4...)' compatibility. The page also includes a search bar, a 'Columns' dropdown, and a 'Labels: All' dropdown. At the bottom, there is a pagination bar showing 'Page 1 / 1' and 'Items 10'.

Direction Argument type

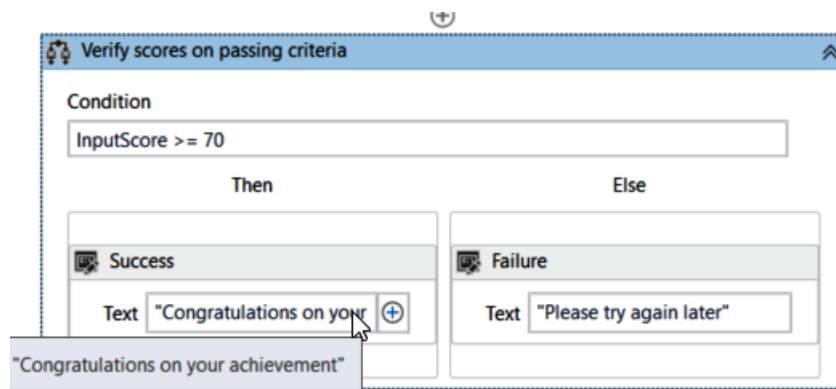

Numeric Type	Description
Int16/32/64	Signed integers (for example, 10, 20, 100, -250).
Long	Holds signed integers ranging from -9,223,372,036,854,775,808 through 9,223,372,036,854,775,808
Double	Allows you to store the largest and smallest possible floating point integers.
Decimal	Decimal supports the storage of values up to 29 significant digits and can represent values above 7.9228×10^{28} . The Decimal type is more suitable for financial calculations as it supports large numbers and does not provide errors while rounding values.

Data Type	Description
DateTime	Used to store specific date and time information regarding a given date. This allows you to perform date-related calculations, such as calculating date durations and subtracting and adding dates.
TimeSpan	Used to measure the duration between two given Time values.

Collection Type	Description
Arrays	Used to store multiple values of the same data type. The size of the object is defined at creation.
Lists	Used to store multiple values of the same data type (similar to Arrays). However, the size of the List may change during execution.
Dictionary	Used to store data values in the form of key-value pair where its unique key refers to each value. In simple words, every value in a Dictionary variable is referenced using a unique key that describes the value in the collection.

Chapter 08: Exploring UiPath Selectors

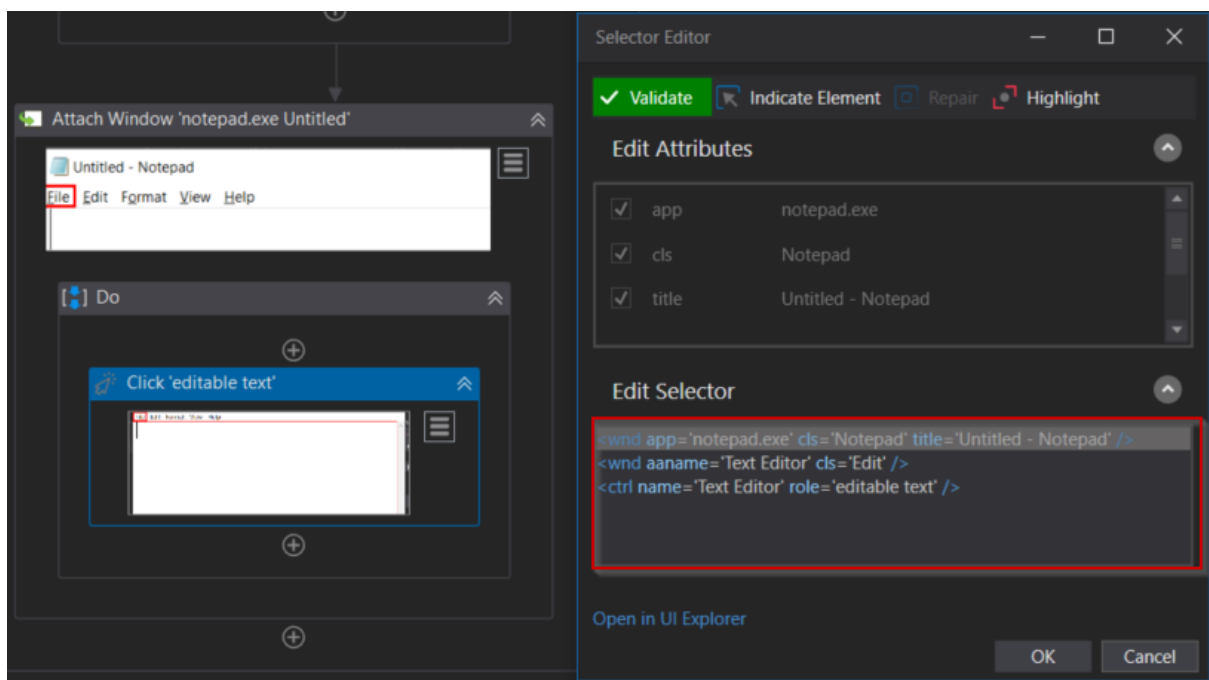

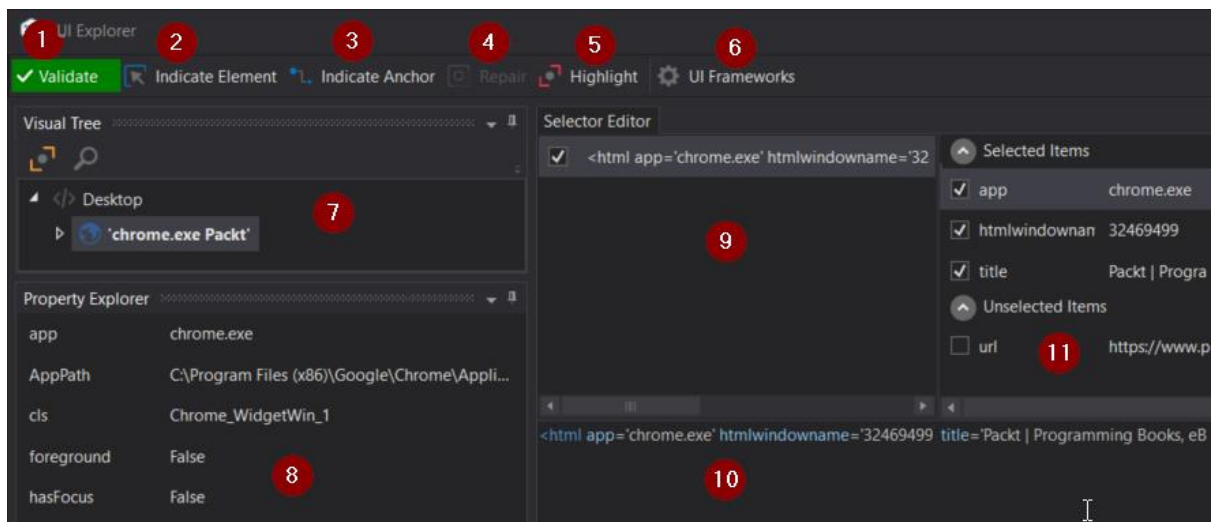

```
<Node_1 >  
<Node_2>  
.....  
<Node_N>
```

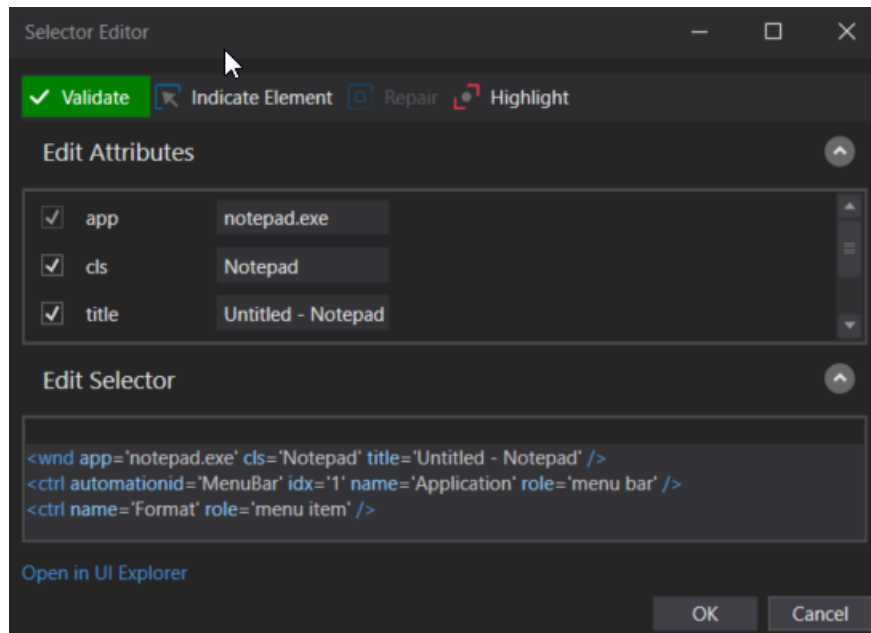

```
<wnd app='notepad.exe' cls='Notepad' title='Untitled -  
Notepad' />  
<wndcls='Edit' />  
<ctrl name='Text Editor' role='editable text' />
```

Partial Selector	Full Selector
Generated by the Desktop Recorder.	Generated by the Basic Recorder.
Does not contain top-level elements.	Contains top-level elements.
Used when switching between multiple windows.	Used when staying inside the same window.
Enclosed inside containers.	Containers are not needed.
All attributes are editable.	Only elements related to partial selectors can be edited.

```
<tag attribute = '{{Value}}' />
```

Static Selector	Dynamic Selector
Used to identify elements that are highly stable by having standard properties.	Used to identify elements that are unstable by changing their properties frequently.
You can hardcode the Property values inside the Edit selector window.	You can parameterize the Property values using variables or arguments inside the Edit selector window.
Uses tags and attributes to identify the target element.	Uses tags, attributes, variables, and arguments to identify the target element.
Indicates the target element for any required changes.	Indicates the target element and makes the necessary changes to the value of the variable or argument.

Chapter 09: Learning the Uses of Data Tables and Exploring Excel Automation

Join Type	Description
Inner Join	<p>It is used when we are sure that we only need the records that match the join conditions specified. The records that do not match are removed from the resulting data table.</p> <p>In simple words, it checks for matching records based on the defined commonly available columns and returns only rows that have a match on both data tables.</p> <p>Example:</p> <p>Returns only the employees that are assigned to a department</p>
Left Join	<p>As we know, a Join includes two data tables. The first data table we specify for the Data Table 1 property is considered as your Left data table. The data table you specify for the Data Table 2 property is considered as your Right data table. You are giving priority to your Left data table the moment you select the join condition as Left Join. Unlike in Inner Join, Left join returns all the rows on your Left data table. However, it also returns all the matching rows it finds from the second data table and empty rows that did not have a match.</p> <p>Example:</p> <p>Returns all the employees along with the information of their assigned department. Further, the result also contains employees with no assigned department.</p>
Full Join	<p>Keep all the records from both data tables irrespective of the join condition. It is more like a combination of both Left Join and Right Join. Full Join adds null values for both sides for the records that do not match.</p>

DataTable 1: Employee DataTable 2: Department

DT1 Department ID = DT2 Department ID

DataTable 1: Employee DataTable 2: Department

DT1 Department ID = DT2 Department ID

DataTable 1: Employee DataTable 2: Department

DT1 Department ID = DT2 Department ID

Missing Schema Handle Option	Description
Add	Adds the missing schema to the destination data table
Ignore	Ignores the schema changes and merges columns already available on both data tables
Error	Throws an error if any schema changes detected
Add with Key	Adds new columns with a built-built key

7									

The screenshot shows the 'Filter Wizard' dialog box with the 'Output Columns' tab selected. The 'Input DataTable' and 'Output DataTable' are both set to 'ProcessedData'. Under 'Keep or remove matching rows', the 'Keep' radio button is selected. A filter rule is defined for the 'Total Payment' column with the operation '>=' and the value '2000'. To the right, the 'Read Range' component is configured with 'ExcelSample.xlsx' and 'Sheet1'. Below it, the 'Filter Data Table' component is configured with 'ProcessedData' for both the 'DataTable' and 'Filtered DataTable' fields.

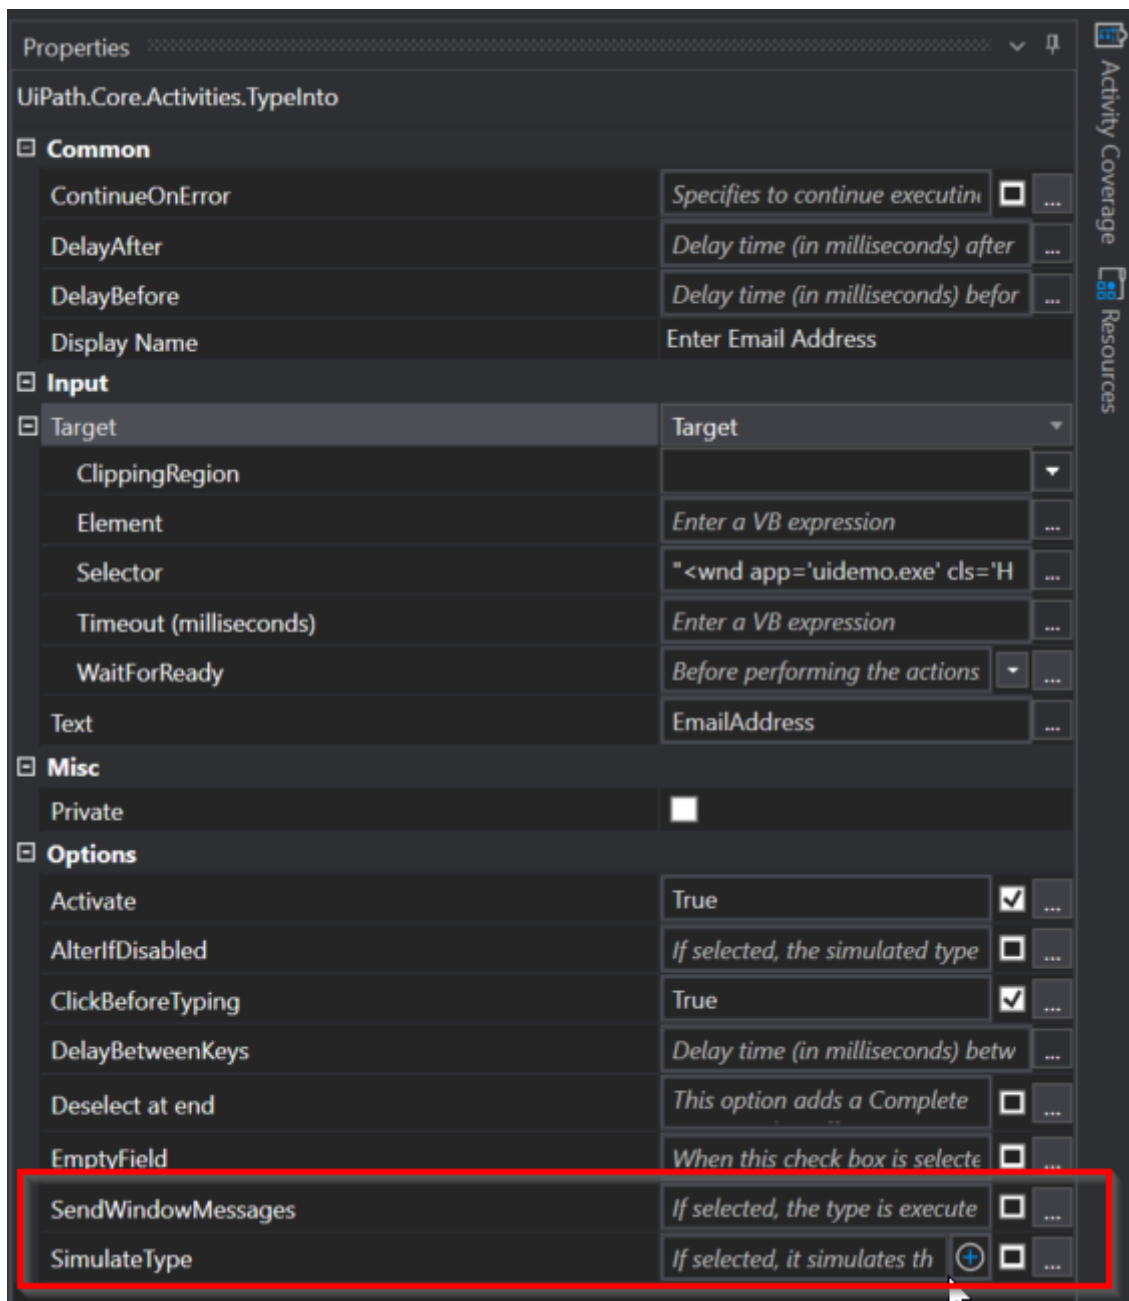

This section shows the 'Filter Data Table' component, which is identical to the one in the previous screenshot. Below it, the 'Write Range' component is configured with 'Output.xlsx' as the file, 'Sheet1' as the sheet, and 'A1' as the starting cell. The 'ProcessedData' variable is selected for the data to be written.

The 'Common' properties panel for the 'Write Range' component is shown. It includes sections for 'Destination' (SheetName: 'Sheet1', StartingCell: 'A1'), 'Input' (DataTable: 'ProcessedData', Workbook path: 'Output.xlsx'), 'Misc' (Private: unchecked), and 'Options' (AddHeaders: checked, Password: 'The password o...').

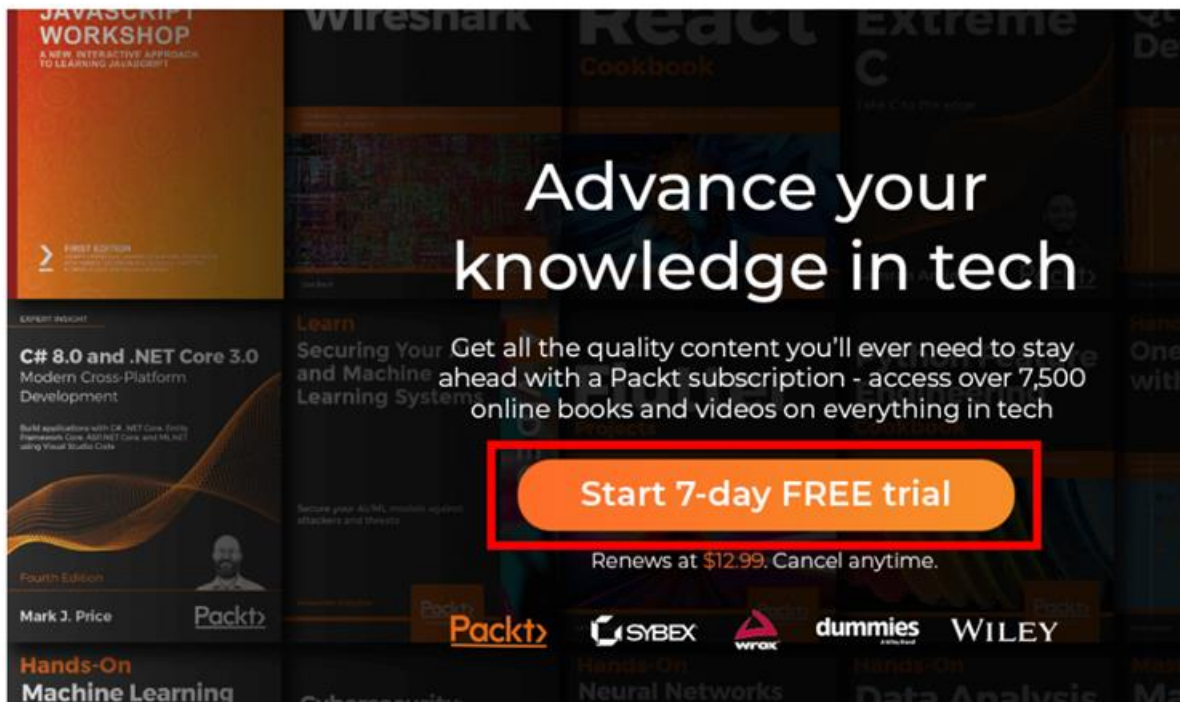

Chapter 10: Exploring User Interfaces and User/Robot Interactions

Activities	Description
Containers	These are used to locate any GUI applications (desktop, web, or mainframes) or to identify active windows or pop up windows to communicate with the elements within the scope of the selected window. Open Browser, Open Application, Attach Browser, and Attach Window are examples of containers.
Input	These activities are used to provide inputs or perform actions on the UI elements. Examples are Click, Type Into, and Send Hotkeys.
Output	These activities instruct the robot to extract data from the GUI. Examples are GetText, GetURL, and GetOCRText.
Synchronization	These activities instruct the robot to perform defined operations based on the GUI behaviors to overcome any unexpected UI behavior. Examples are Element Exists, Image Exists, and Wait Element Vanish.

A promotional banner for Packt's subscription service. The background is a collage of various technical book covers, including 'JAVASCRIPT WORKSHOP', 'Wireshark', 'React Cookbook', 'Extreme C', 'C# 8.0 and .NET Core 3.0', 'Securing Your and Machine Learning Systems', 'Hands-On Machine Learning', 'Cybersecurity', 'Neural Networks', and 'Data Analysis'. The main headline reads 'Advance your knowledge in tech'. Below this, a sub-headline states: 'Get all the quality content you'll ever need to stay ahead with a Packt subscription - access over 7,500 online books and videos on everything in tech'. A prominent orange button with a red border says 'Start 7-day FREE trial'. Below the button, it says 'Renews at \$12.99. Cancel anytime.' At the bottom, there are logos for Packt, SYBEX, Wrox, dummies, and WILEY.

Recording Type	Usage, Advantages, and Disadvantages
Basic	<ul style="list-style-type: none"> • Best suited for linear workflows where not many windows or web pages are involved. • It is the slowest type of recording. • Can automate desktop and web applications. • SimulateType / SimulateClick is not enabled (False) by default.
Desktop	<ul style="list-style-type: none"> • Suitable for all types of desktop applications where multiple windows and web pages are involved. • Generates partial selectors for each activity. • It is faster than the Basic recording.
Web	<ul style="list-style-type: none"> • Best suited for recording web applications where multiple pages and actions are involved. • Generates partial selectors for each activity (for example, Attach Browser). • It is faster than the Basic recording. • SimulateType / SimulateClick is enabled (True) by default.
Image	<ul style="list-style-type: none"> • Only use it if you want to record virtualized environments (such as Virtual Networking Computers, virtual machines, and Citrix) or SAP. • It allows only image, text, and keyboard automation, and requires explicit positioning.
Native Citrix	<ul style="list-style-type: none"> • Only used in native Citrix automation projects. • As a prerequisite, you need to install the UiPath Citrix extension on the client machine and the UiPath Remote Runtime component (Citrix XenApp) on the application servers. • You can use activities such as Click, Type Into, Get Text, and Extract Data. • Selectors are natively generated for Citrix application elements.
Computer Vision	<ul style="list-style-type: none"> • It uses computer vision neural networks to identify UI elements such as buttons, texts, and checkboxes. • It does not use selectors. • Used to record virtualized environments (such as VNC, virtual machines, Citrix, and remote desktops). • Automating local applications where the other mentioned recording options are not reliable.

Chapter 11: Automating PDF Data Extraction

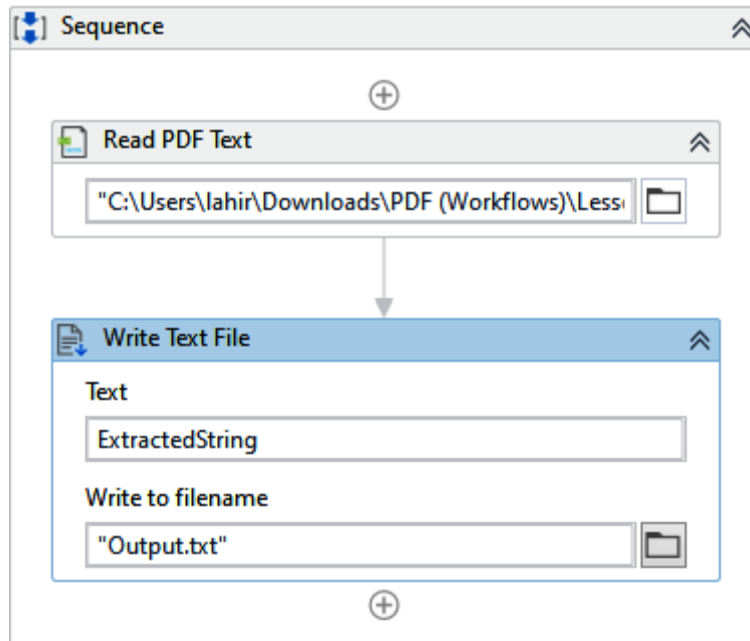

It was November. Although it was not yet late, the sky was dark when I turned into Laundress Passage. I closed the door and put the shop key in its usual place behind Bailey's Advanced Principles of Geometry. Poor Bailey. No one has wanted his fat gray book for thirty years. Sometimes I wonder what he makes of his role as guardian of the bookshop keys. I don't suppose it's the destiny he had in mind for the masterwork that he spent two decades writing.

A letter. For me. That was something of an event. The crisp-cornered envelope, puffed up with its thickly folded contents, was addressed in a hand that must have given the postman a certain amount of trouble. Although the style of the writing was old-fashioned, with its

heavily embellished capitals and curly flourishes, my first impression was that it had been written by a child. The letters seemed untrained. Their uneven strokes either faded into nothing or were heavily etched into the paper. There was no sense of flow in the letters that spelled out my name. Each had been undertaken separately -- M A R G A R E T L E A -- as a new and daunting enterprise. But I knew no children. That is when I thought, It is the hand of an invalid.

It gave me a queer feeling. Yesterday or the day before, while I had been going about my business, quietly and in private, some

The screenshot shows a Visual Studio window with a sequence diagram titled "Sequence (ReadOnly)". The diagram contains a "While" loop with the condition "num < 8". Inside the loop, there is a "Write Line" activity with the text "num.ToString" and an "Assign" activity with the expression "num = num + 1". A tooltip for the "Write Line" activity shows the condition "num Mod 2 = 0" and a hit count of 2. To the right, the "Breakpoints" window is open, showing a table with columns "Activity Name", "File Path", "Condition", and "Log Message". The table contains one entry: "Write Line", "Sequence.xaml", "num Mod 2 = 0". Below the table, the "Output" window shows a list of messages: "Debug started for file: Sequence", "Contact_Details execution started", "1", "2", and "3".
