What Spring can do

Microservices

Quickly deliver production-grade features with independently evolvable microservices.

Reactive

Spring's asynchronous, nonblocking architecture means you can get more from your computing resources.

Cloud

Your code, any cloud—we've got you covered. Connect and scale your services, whatever your platform.

Web apps

Frameworks for fast, secure, and responsive web applications connected to any data store.

Serverless

The ultimate flexibility. Scale up on demand and scale to zero when there's no demand.

Event Driven

Integrate with your enterprise. React to business events. Act on your streaming data in realtime.

Batch

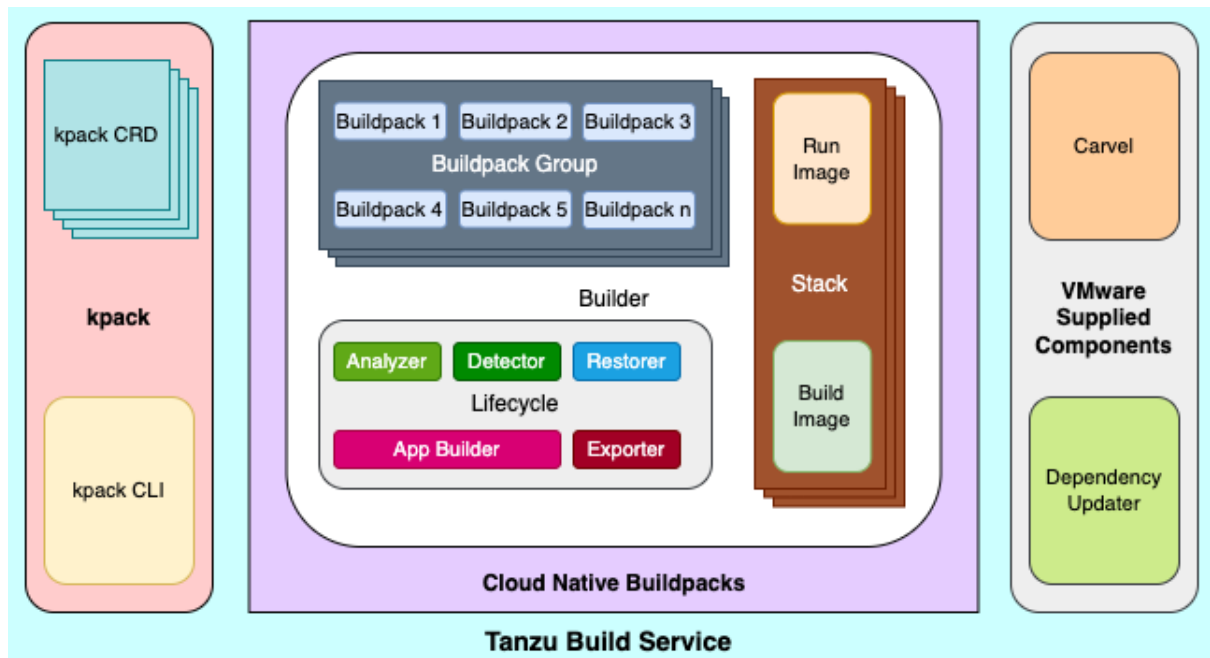

Automated tasks. Offline processing of data at a time to suit you.

MySQL

MySQL is a fast, reliable, scalable, and easy to use open-source relational database system. MySQL Server is intended for mission-critical, heavy-load production systems as well as for embedding into mass-deployed software.

TL;DR

```
$ helm repo add bitnami https://charts.bitnami.com/bitnami
$ helm install my-release bitnami/mysql
```

Introduction

This chart bootstraps a MySQL replication cluster deployment on a Kubernetes cluster using the Helm package manager.

Bitnami charts can be used with Kubeapps for deployment and management of Helm Charts in clusters. This Helm chart has been tested on top of Bitnami Kubernetes Production Runtime (BKPR). Deploy BKPR to get automated TLS certificates, logging and monitoring for your applications.

Prerequisites

- Kubernetes 1.19+
- Helm 3.2.0+
- PV provisioner support in the underlying infrastructure

Project registry

☐ Public

Making a project registry public will make all repositories accessible to everyone.

Deployment security

☐ Enable content trust

Allow only verified images to be deployed.

☐ Prevent vulnerable images from running.

Prevent images with vulnerability severity of Low and above from being deployed.

Vulnerability scanning

☒ Automatically scan images on push

Automatically scan images when they are pushed to the project registry.

CVE allowlist

Project allowlist allows vulnerabilities in this list to be ignored in this project when pushing and pulling images. You can either use the default allowlist configured at the system level or click on 'Project allowlist' to create a new allowlist. Add individual CVE IDs before clicking 'COPY FROM SYSTEM' to add system allowlist as well.

Add Tag Retention Rule

Specify a tag retention rule for this project. All tag retention rules are independently calculated and each rule can be applied to a selected list of repositories.

For the repositories matching mysql
Enter multiple comma separated repos,repo*,or **

By artifact count or number of days retain the most recently pulled # artifacts COUNT 1

Tags matching ** untagged artifacts ☒
Enter multiple comma separated tags, tag*, or **. Optionally include all untagged artifacts when applying the 'including' or 'excluding' selector by checking the box above.

EXPORT CONFIGURATION

Deploying Tanzu Kubernetes Grid on AWS

Deployment of the Tanzu Kubernetes Grid management cluster to AWS is in progress.

✔ Configure prerequisite

✔ Validate configuration

✔ Generate cluster configuration

✔ Setup bootstrap cluster

✔ Install providers on bootstrap cluster

● Create management cluster

○ Install providers on management cluster

○ Move cluster-api objects from bootstrap cluster to management cluster

Logs

```

[READ MORE](#)

Embedded Code Editor

Editors **vi** and **nano** are provided for working from the terminal, however not everyone will be familiar with using these editors. For that reason a GUI based IDE usually provides a better experience for workshops as you don't have to worry so much about the users experience level.

The embedded IDE which can be enabled for the workshop environments is VS Code. This runs in the same container that the workshop session uses and is available under the "Editor" tab, or you can provide a clickable action to expose the tab.

Dashboard: Open dashboard "Editor"

In order to help guide users when viewing, creating or editing files, a range of clickable actions are provided which can act directly on the VS Code editor.

Actions include being able to open a file:

TERMINAL CONSOLE EDITOR

22:43

EXPLORER

Greetings from Spring Boot + Tanzu!

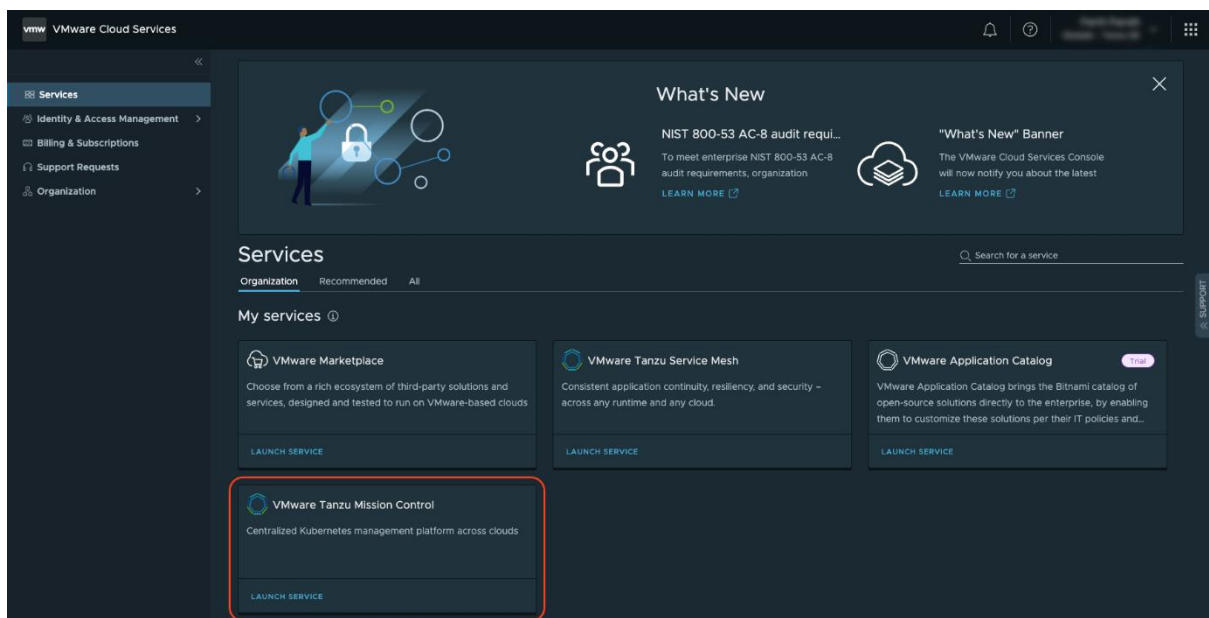

Chapter 9: Managing and Controlling Kubernetes Clusters with Tanzu Mission Control

The screenshot shows the 'Clusters' page in the Tanzu Mission Control console. The left sidebar contains navigation links for Cluster Groups, Clusters, Workspaces, Namespaces, Workloads, Policies, Cluster Inspection, and Settings. The main area displays a table of clusters with columns for Cluster, Provider, Type, Status, Health, Version, Allocated Memory, Allocated CPU, Nodes, and Labels. Buttons for DETACH and DELETE are visible at the top of the table.

Cluster	Provider	Type	Status	Health	Version	Allocated Memory	Allocated CPU	Nodes	Labels
azure-dev-cluster-01	Azure	Attached	Ready	✓	v1.15.3	10% 1.54 GB / 16.02 GB	40% 1.6 CPUs / 4 CPUs	1	
development-cluster-0	aws	Provisioned	Ready	✓	v1.14.1	6% 1.85 GB / 30.33 GB	38% 3 CPUs / 8 CPUs	4	
development-cluster-2	aws	Provisioned	Ready	✓	v1.14.1	2% 936 MB / 45.49 GB	24% 2.88 CPUs / 12 CPUs	6	
enterprise-pks-dev	OpenShift	Attached	Ready	✓	v1.13.5	31% 3.63 GB / 11.54 GB	23% 1.4 CPUs / 6 CPUs	3	
enterprise-pks-production	OpenShift	Attached	Ready	✓	v1.13.5	45% 5.19 GB / 11.54 GB	42% 2.51 CPUs / 6 CPUs	3

RESTORE

Direct Custom policies

Custom policy

tmc-require-labels

Enforce labels on Kubernetes resources. Label keys (required) and values (optional) provided will be enforced on specified target resources.

Policy name

tmc-deployment-policy-demo

Name must start and end with a letter or number, and can contain only lowercase letters, numbers, and hyphens.

Target Resource

TargetKubernetesResources is a list of kubernetes api resources on which the policy will be enforced, identified using apiGroups and kinds. You can use 'kubectl api-resources' to view the list of available api resources on your cluster.

Monitor Your Containers

Kubernetes

Kubernetes

Wavefront provides a comprehensive solution for monitoring Kubernetes. Collects real-time metrics from all layers of a Kubernetes environment (clusters, nodes, pods, containers, and the Kubernetes control plane). Supports plugins such as Prometheus, Telegraf, and Systemd; enabling you to collect metrics from various workloads.

You don't have data flowing yet.

When data is flowing, your dashboards will show up here.

Where do you want to install the Wavefront Collector for Kubernetes?

Install in Tanzu Cluster

Install in Kubernetes Cluster

Install in OpenShift Cluster

Kubernetes Quick Install using Helm

If you prefer not to use Helm, follow the [manual installation instructions](#).

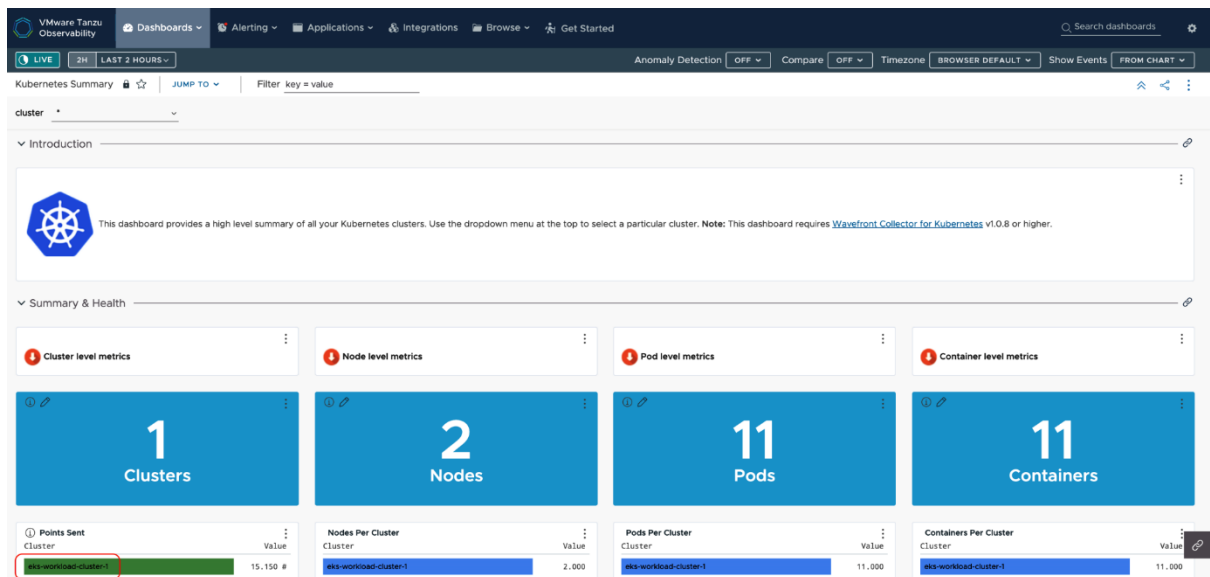

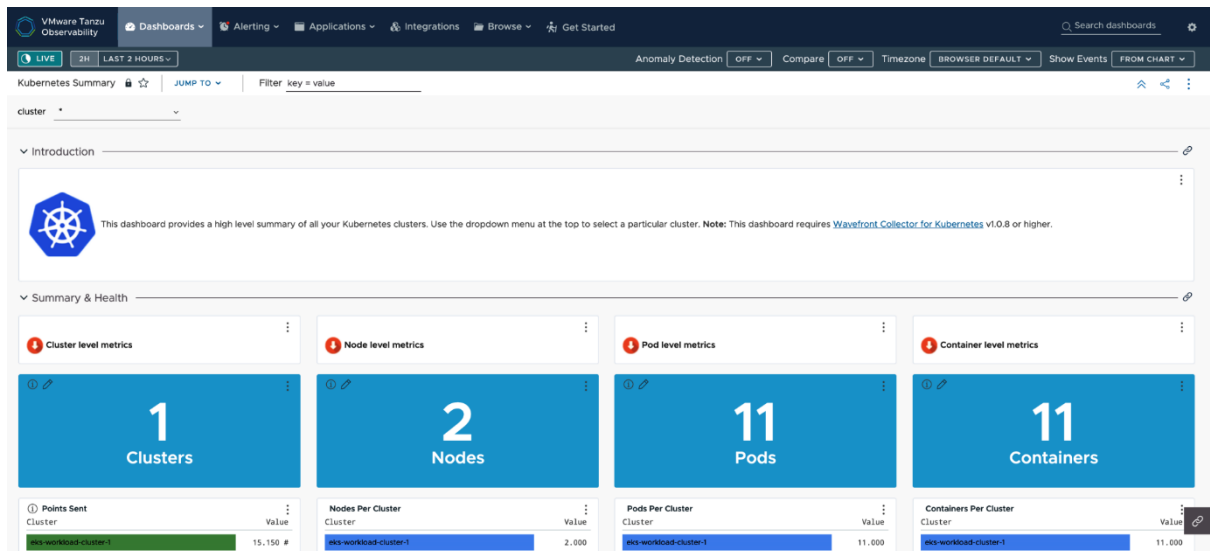

- Step 1
Install Helm: Ensure that you have [Helm](#) installed. This is a one-time install.
- Step 2
After you have Helm installed, copy and run the following command in the command line.

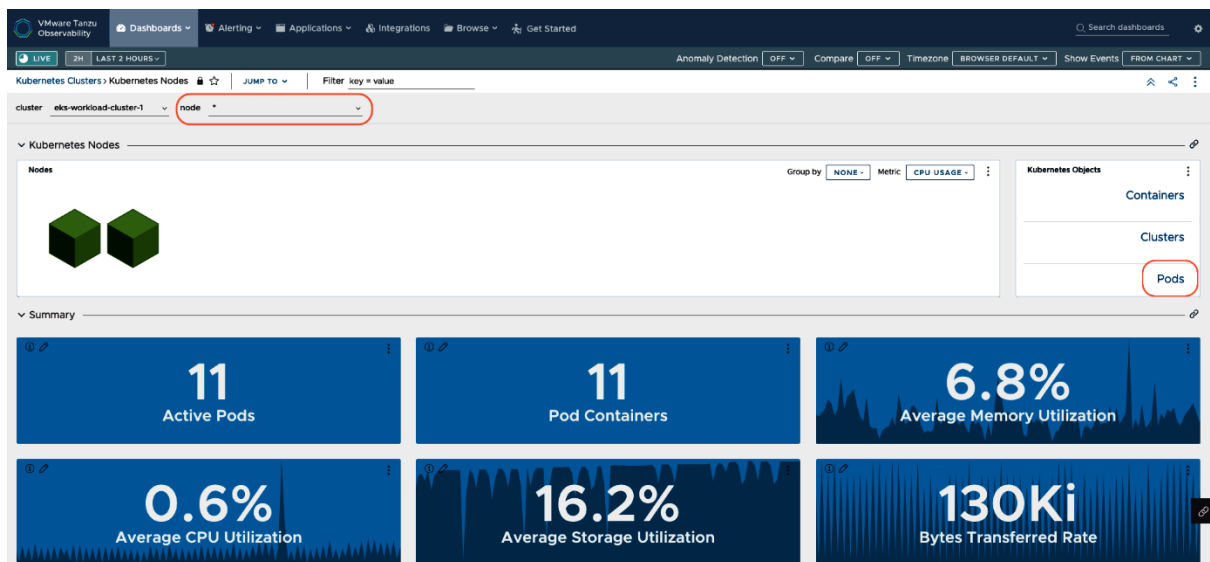

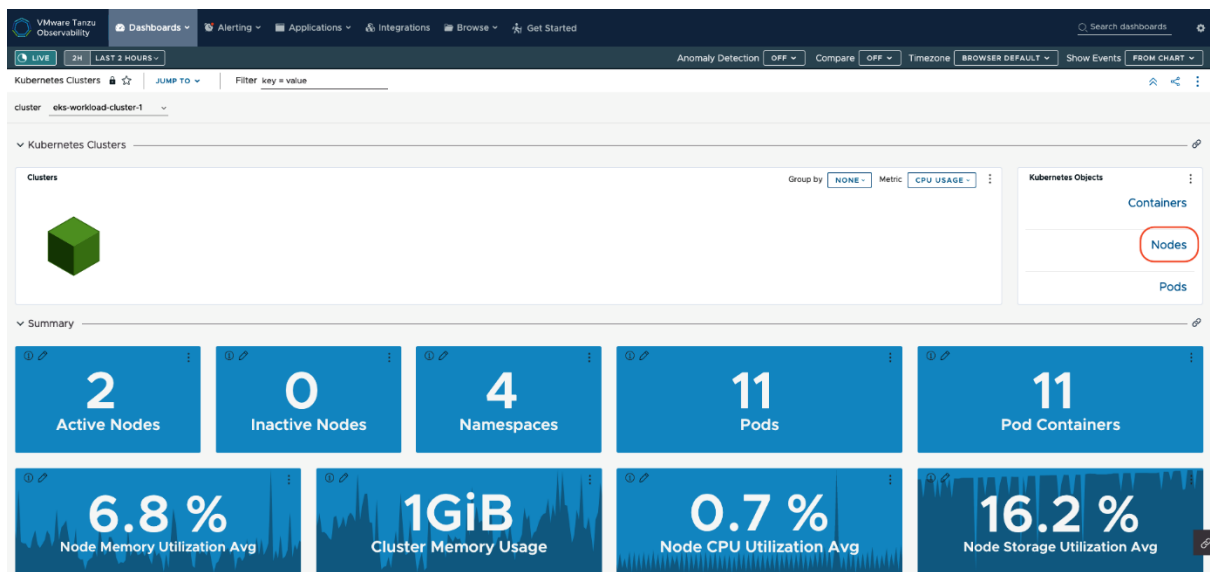

```
helm repo add wavefront https://wavefronthq.github.io/helm/ && helm repo update
```
- Step 3
Enter your cluster name, then copy and run the following command in the command line.

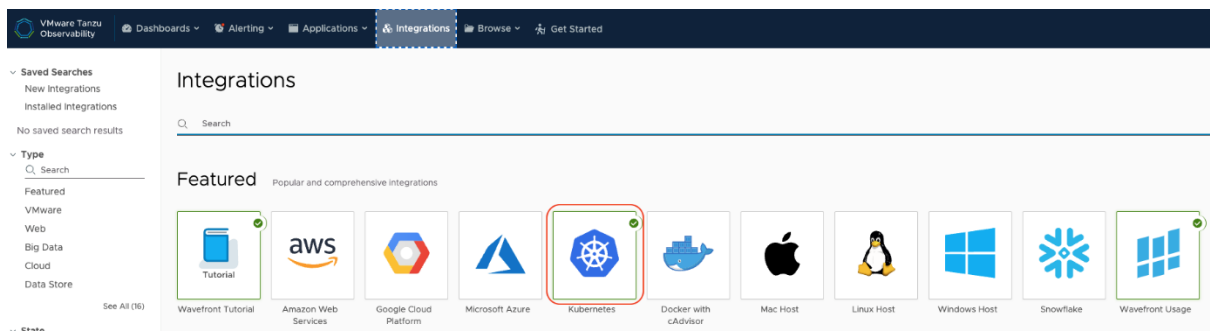

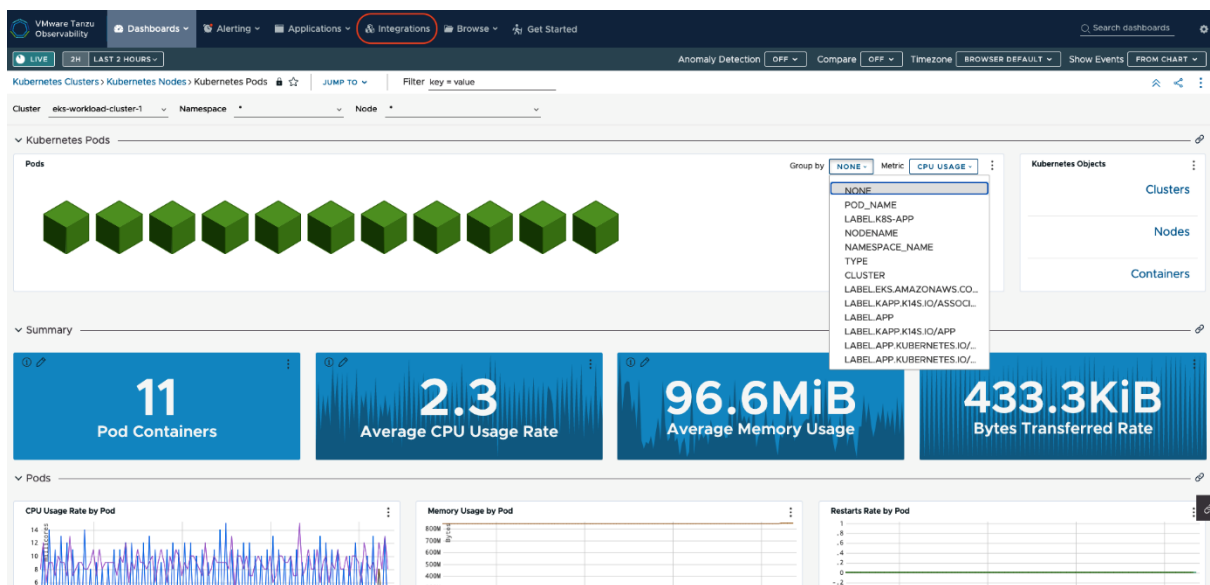

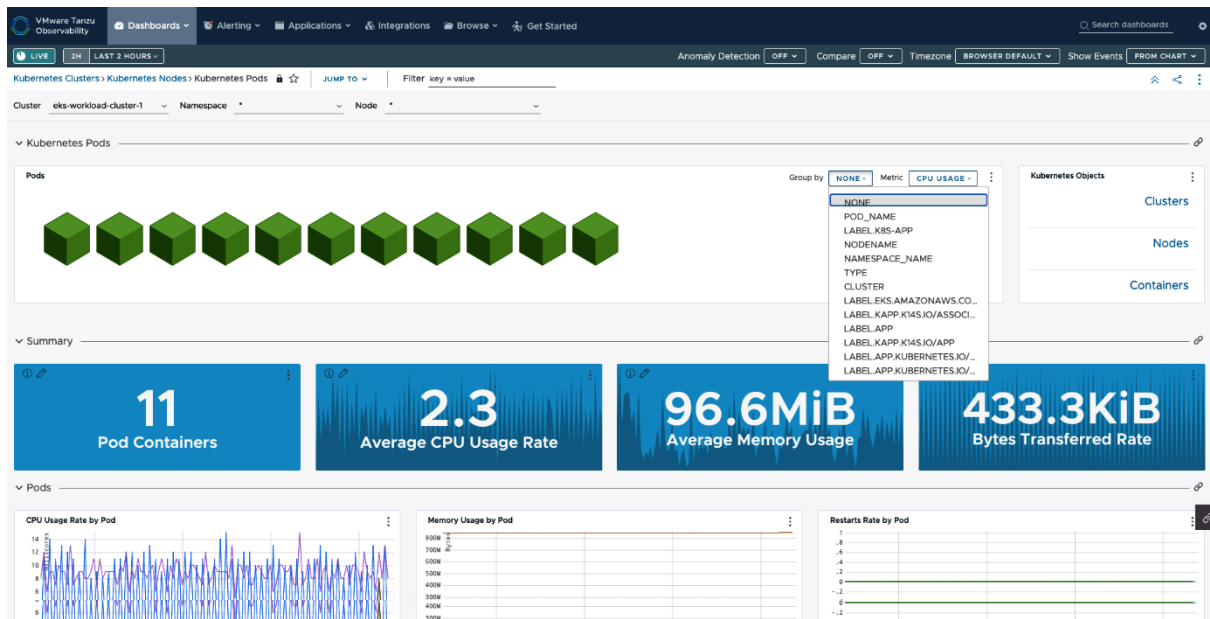

Cluster Name
Your cluster name

> ADDITIONAL SETTINGS

```
kubectl create namespace wavefront && helm install wavefront wavefront/wavefront \
--set wavefront.url=https://longboard.wavefront.com \
--set wavefront.token=XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX \
--set clusterName="<YOUR_CLUSTER_NAME>" --namespace wavefront
```

Kubernetes Alerts

UNINSTALL ALL

K8s pod CPU usage too high

edit

Alert reports when the CPU millicore utilization of a pod exceeds the CPU millicore limit defined constantly. Having the CPU going over the set limit will cause the pod to suffer from CPU throttling which is going to affect the pod's performance. When this happens, please make sure the CPU resource limitation set for the pod is correctly configured.

K8s pod memory usage too high

edit

Alert reports when the memory utilization of a pod is constantly at high percentage.

K8s too many pods crashing

edit

Alert reports when a pod's running and succeeded phase percentage is below the required level specified.

K8s node CPU usage too high

edit

Alert reports when a node's cpu utilization percentage is constantly high.

K8s node storage usage too high

edit

Alert reports when a node's storage is almost full.

K8s node memory usage too high

edit

Alert reports when the memory utilization of a node is constantly high.

K8s too many containers not running

edit

2. Namespace Mapping

Set up mapping rules to define the services included in this global namespace. You can select multiple namespaces across multiple clusters in different locations, e.g. "dev" namespaces in two public clouds and on-prem cluster.
